Supplementary information:
 1) An Arcing PIS requires a minimum of 50 V (peak) a.c. or d.c. An Arcing PIS is established when the product of the open circuit voltage (V_p) and normal operating condition rms current (I_{rms}) is greater than 15.

Supplementary information:
 1) A combination of voltmeter, VA and ammeter I_A may be used instead of a wattmeter. If a separate voltmeter and ammeter are used, the product of (VA x I_A) is used to determine Resistive PIS classification.
 2) A Resistive PIS: (a) dissipates more than 15 W, measured after 30 s of normal operation, or (b) under single fault conditions has either a power exceeding 100 W measured immediately after the introduction of the fault if electronic circuits, regulators or PTC devices are used, or has an available power exceeding 15 W measured 30 s after introduction of the fault.
 3) All components located within the EUT are considered as resistive PIS.
